

Relevant Skills

- C#
- Java
- Python
- React
- ASP.NET MVC & Core
- Spring Boot
- Maven
- MySQL
- MongoDB
- Docker
- CI/CD
- GitLab/GitHub
- Agile

Personal Skills

- Problem solving
- Attention to detail
- Teamwork
- Fast learner

Spoken Languages

- English
- Polish

Projects

Public Personal Projects Repo (www.github.com/Adrian-Sz1)

Planet Mesh Generator Sample A Unity-based tool for generating 3D planetary meshes for procedural terrain generation and biomes using simplex noise functions and multithreading

Personal Summary

Self-driven and passionate graduate software engineer with one year of hands-on professional full-stack development experience using ASP.NET MVC and Core, Microsoft SQL Server and JavaScript within an agile workflow. Proficient in managing large codebases, deploying applications using Google Cloud Compute Engine and maintaining CI/CD pipelines using Docker for containerization. Passionate about problem-solving and committed to continuous learning.

Education

September 2020 – June 2024 Software Engineering BEng with Placement

Queen’s University Belfast

Grade Classification	2:1
Relevant modules:	
Concurrent Programming:	71
Cloud Computing:	70
Software Engineering Project:	72

September 2018 – June 2020 A-Levels

Abbey Christian Brothers’ Grammar School

Environmental Technology	A
Technology & Design	A
Geography	B

Work Experience

June 2022 – June 2023 Software Engineer Intern

NantHealth

Key Responsibilities

- Worked as part of a highly experienced 5-person team utilizing the Kanban agile methodology and Git version control in a remote and on-site environment
- Contributed to the development, maintenance, and testing of a full-stack codebase using ASP.NET for backend services and JavaScript for frontend interfaces.
- Collaborated closely with cross-functional teams across different time zones to coordinate deployments and resolve critical issues especially during major feature deployments

Key Achievements

- Pioneered a mock JWT client data debugging tool during a “Spark Day” innovation competition jointly with the team lead. The tool received positive feedback from developers and QA teams, leading to its project-wide adoption. It significantly reduced defects when handling client data by enabling faster data validation and efficient testing of data manipulation functions
- Overhauled form submission process, designing a more streamlined and intuitive user interface from the ground up. This involved reworking both the backend ASP.NET and Knockout.js logic, implementing frontend and backend validation, and integrating with the SQL database
- Coordinated a successful deployment of a major Minimal Viable Feature to User Acceptance Testing (UAT), collaborating with cross-functional teams across multiple time zones to ensure seamless execution.
